This report is prepared in accordance with the requirements of 12 U.S.C. § 635g(g)(1).

“(g) Monitoring of default rates on bank financing; reports on default rates; safety and soundness review

“(1) MONITORING OF DEFAULT RATES.—Not less frequently than quarterly, the Bank shall calculate the rate at which the entities to which the Bank has provided short-, medium-, or long-term financing are in default on a payment obligation under the financing, by dividing the total amount of the required payments that are overdue by the total amount of the financing involved.

“(2) ADDITIONAL CALCULATION BY TYPE OF PRODUCT, BY KEY MARKET, AND BY INDUSTRY SECTOR; REPORT TO CONGRESS—In addition, the Bank shall, not less frequently than quarterly—

(A) calculate the rate of default—
   (i) with respect to whether the products involved are short-term loans, medium-term loans, long-term loans, insurance, medium-term guarantees, or long-term guarantees;
   (ii) with respect to each key market involved; and
   (iii) with respect to each industry sector involved; and
(B) submit to the Committee on Banking, Housing, and Urban Affairs of the Senate and the Committee on Financial Services of the House of Representatives a report on each such rate and any information the Bank deems relevant.
EXECUTIVE SUMMARY

ABOUT EXIM
The Export-Import Bank of the United States (EXIM) supports and promotes American jobs through exports. EXIM provides export financing through its loan, guarantee, and insurance programs in cases where the private sector is unable or unwilling to provide financing. For some American exporters, accessing needed export financing may be difficult for certain creditworthy transactions because of: regulatory constraints; the credit risk of the country acquiring the exports; and/or competition from foreign export promotion efforts. EXIM offers needed support to facilitate these transactions that are creditworthy but face unique challenges.

DEFAULT RATE
The default rate, as defined in this report, reflects actual defaults at a point in time. EXIM’s default rate as of March 31, 2020, is **0.473 percent** as shown in Exhibit 1. This rate was calculated pursuant to the requirements of 12 U.S.C. § 635g(g)(1) and, accordingly, reflects a “total amount of required payments that are overdue” (claims paid on guarantees and insurance transactions plus loans past due) divided by a “total amount of financing involved” (disbursements). The default rate of 0.473 percent is well below the statutory two percent cap at which EXIM’s lending cap would immediately freeze. While EXIM’s default has remained relatively steady, two transactions that defaulted due to financial and operational issues that pre-existed the outbreak of COVID-19 caused the March 2020 default rate to slightly increase from the December 2019 default rate of 0.452 percent. The low default rates are the result of the agency’s continuous efforts to improve its strong underwriting processes, employee expertise, and effective portfolio management in the monitoring of exposure and recoveries on those credits that default.

---

1 This default differs from the default rates published in the Federal Credit Supplement for the President’s Annual Budget. The reported rate in the Budget Appendix reflects projected defaults over the life of the loan while the default rate in this report reflects actual defaults at a point in time. The Federal Credit Supplement can be found at https://www.whitehouse.gov/omb/supplemental-materials/.
2 The default rate is based on actual disbursements and not authorized financing amounts.
3 12 U.S.C. § 635e(b)
**Default Rate**

**Defined**
The statute requires that EXIM calculate the “default on a payment obligation [...] by dividing the total amount of the required payments that are overdue by the total amount of the financing involved.”

EXIM calculates its default rate on the total financing of its active credit portfolio. Any disbursed loan, guarantee, or insurance policy that will mature after the date of this report is included as part of the active portfolio. Any claim payments made for guarantees and insurance transactions and any direct loan payments in arrears in EXIM’s active portfolio are considered to be in default.

Data used to calculate the default rate is derived from information contained in EXIM’s financial system of record, which records all accounting data for all authorized transactions. EXIM uses this data to calculate the components of the default rate.

**Risk Management**
Providing support to United States exporters is key to the mission of EXIM as an institution and an effective comprehensive risk management framework is an integral, underlying requisite for the agency to properly utilize its authority, provide transparency, and strengthen taxpayer protections. EXIM continues to conduct prudent oversight and due diligence through a comprehensive risk management framework. This framework starts with effective underwriting to ensure a reasonable assurance of repayment. Risk management continues after a transaction is approved with proactive monitoring efforts to minimize defaults and aggressively pursue recoveries, when appropriate. EXIM also engages in oversight and governance of the agency’s portfolio, which includes setting aside adequate loan loss reserves for all transactions.

---

4 12 U.S.C. § 635gg(1)
**COMPONENTS OF THE DEFAULT RATE**

**Numerator – Overdue Payments**
The “total amount of required payments that are overdue,” representing the numerator, is defined as claims paid on guarantees and insurance transactions as well as unpaid past due installments on loans in EXIM’s active portfolio, net of any recovered amounts collected and expenses incurred related to recovery efforts. The breakdown of the components of overdue payments is provided below.

\[
\text{Overdue Payments} = \$528.1\text{M} \quad \text{(Defaults Paid)} - \$28.3\text{M} \quad \text{(Recoveries)} + \$0.6\text{M} \quad \text{(Expenses)} = \$500.3\text{M}
\]

**Defaults Paid**
Defaults paid is calculated differently for direct loans, loan guarantees and insurance transactions. For loan guarantees and insurance transactions, upon default of a payment obligation by the foreign buyer of the U.S. export, EXIM pays a claim to the guarantors or the insured parties. These claim payments represent defaults paid. For loans, all monies 30 days or more past due are considered defaults. As of March 2020, EXIM paid out $111.1 million in claims and had $417.0 million loans past due in its active portfolio for a total of $528.1 million in defaults paid.

**Recoveries**
Recoveries made after a default are applied to the specific claim paid or to the loan in arrears and thereby reduce the amount overdue. All recovered amounts are discounted to the time of claim payment or when the direct loan went into arrears. As of March 2020, EXIM recovered $28.3 million. These recoveries, as well as fees collected from borrowers, are used to offset default claims paid. Recovery efforts occur on a continuous basis, and EXIM frequently collects recoveries for several years after the initial default.

**Expenses**
All expenses incurred related to EXIM’s recovery efforts are added to the amount overdue. As of March 2020, EXIM incurred $0.6 million of expenses related to the recovery process.

**Denominator – Total Financing**
The “total amount of financing involved,” the denominator, is defined as the disbursed financing associated with EXIM’s active portfolio.

\[
\text{Total Financing} = \$105,863.4\text{M} \quad \text{(Disbursements)}
\]

As of March 2020, EXIM provided a total financing of $105,863.4 million under its loan, guarantee, and insurance programs.
**Disbursements**

After a credit is approved, the value of the goods and services financed by EXIM is recorded once the goods are delivered to the buyer. Under the guarantee and insurance programs, the private sector provides transaction financing, and the transaction is guaranteed or insured by EXIM. The guaranteed or insured party notifies EXIM when a shipment of goods has occurred or services have been provided, and EXIM records a non-cash “disbursement” to reflect the value of the goods guaranteed or insured by EXIM. Under the direct loan program, the goods and services are financed directly by EXIM. Funds are disbursed to pay for the goods or services delivered to the buyer, and a loan receivable, with appropriate loss reserves, is reflected in EXIM’s financial system of record. An appropriate loss reserve, based on the expected loss of the transaction, is also recorded on EXIM’s books. Depending on the type of goods and services financed, the delivery (or disbursement) can occur over a period of several years.

**Default Rate Calculation**

As of March 2020, the total amount of the required payments that are overdue ($500.3 million) divided by the total amount of the financing involved ($105,863.4 million) equated to a default rate of 0.473 percent for EXIM.

\[
\text{EXIM Default Rate (Mar. 2020)} = \frac{\$500.3\text{M}}{\$105,863.4\text{M}} = 0.473\%
\]

**Exposure**

EXIM’s exposure differs from the total financing amount. Exposure includes authorized outstanding and undisbursed principal balance of direct loans, loan guarantees, and insurance. Total financing amount refers to only disbursements.

As of March 2020, EXIM’s exposure stood at $47.8 billion. EXIM’s total exposure may not exceed $135.0 billion. Additionally, the law requires:

“(3) **Freezing of lending cap if default rate is 2 percent or more.** If the rate calculated under section 635g(g)(1) of this title is 2 percent or more for a quarter, the Bank may not exceed the amount of loans, guarantees, and insurance outstanding on the last day of that quarter until the rate calculated under section 635g(g)(1) is less than 2 percent.”

As of March 2020, EXIM’s default rate of 0.473 percent is significantly below the two percent threshold. With the current default rate below two percent, EXIM’s total exposure cap remains $135.0 billion.

---

5 EXIM adheres to the provisions of the **Federal Credit Reform Act of 1990**, as amended (2 U.S.C. §§ 661-661f), when executing its reserving practices.

6 12 U.S.C. § 635e(a)(1)

7 12 U.S.C. § 635e(a)(3)
Reserves
In addition to reserve requirements under the *Federal Credit Reform Act of 1990*, as amended, EXIM must maintain a certain level of total reserves to protect against future losses.8

*6(b) Reserve Requirement. The Bank shall build to and hold in reserve, to protect against future losses, an amount that is not less than 5 percent of the aggregate amount of disbursed and outstanding loans, guarantees, and insurance of the Bank.*

As of September 30, 2019, EXIM total reserves equaled $3.3 billion, which was 7.0 percent of EXIM's outstanding exposure ($47.3 billion).

---

8 12 U.S.C. § 635e(b)
DEFAULT RATE – BY SUBCATEGORIES

DEFAULT RATE: BY SUBCATEGORY
As required by statute, EXIM has calculated default rates based on each subcategory as of March 31, 2020.  

“(2) ADDITIONAL CALCULATION BY TYPE OF PRODUCT, BY KEY MARKET, AND BY INDUSTRY SECTOR; REPORT TO CONGRESS.”

By Type of Product
EXIM offers loans, guarantees, and insurance products. EXIM reports the default rate for: short-term loans; medium-term loans; long-term loans; insurance; medium-term guarantees; and long-term guarantees. In general, short-term transactions are less than one year, medium-term transactions have a tenor greater than one year and are under $25 million; and long-term transactions are all transactions greater than one year and more than $25 million. As of March 31, 2020, all products had a default rate below 2 percent. Exhibit 2 provides a breakout of the default rate by product.

9 12 U.S.C. § 635(g)(2)
10 EXIM does not offer short-term loans.
11 Consistent with Section 54002(a) of the Export-Import Bank Reform and Reauthorization Act of 2015 (P.L. 114-94), the medium-term program’s financing cap was expanded from $10 million to $25 million, effective May 2019. The default rate of medium-term financing is calculated on the categorization of the transaction at the time of authorization.
**By Industry Sector**
The four largest industries in EXIM’s active portfolio are Air Transportation, Manufacturing, Oil & Gas, and Power Projects. These sectors account for 87.8 percent of the total amount of EXIM financing, and all sectors have experienced a default rate below 2 percent as shown in Exhibit 3.

**By Key Market**
As of March 31, 2020, EXIM has exposure in more than 160 countries. As shown in Exhibit 4, the top ten markets, except for Australia, have experienced a default rate well below two percent. The default rate for Australia is primarily driven by one default that occurred in 2015 that is a relatively large share of the total financing. Excluding the single defaulted credit, the default rate for the balance of exposure to Australia is 0.000 percent.

---

12 The ten key markets reflect top ten markets by total financing.
**Default Rate: By Mandate**

EXIM has congressional mandates to support small business, environmentally beneficial, and Sub-Saharan Africa transactions.

**EXIM Mandates**

- **Small Business Mandate** (12 U.S.C. § 635(b)(1)(E)(v)): “the Bank shall make available... an amount to finance exports directly by small business concerns (as defined under section 632 of title 15) which shall be not less than 30 percent of such authority for each fiscal year.”

- **Environmentally Beneficial Mandate** (12 U.S.C. § 635i-5(b)(1)): “The Bank shall encourage the use of its programs to support the export of goods and services that have beneficial effects on the environment or mitigate potential adverse environmental effects....”

- **Sub-Saharan Africa Mandate** (12 U.S.C. § 635(b)(9)(A)): “The Board of Directors of the Bank shall ... promote the expansion of the Bank's financial commitments in sub-Saharan Africa....”

Transactions associated with these mandates account for 11.2 percent of the total amount of EXIM financing. As of March 31, 2020, all mandates, except for Environmentally Beneficial, have experienced a default rate below two percent as shown in Exhibit 5. The Environmentally Beneficial default rate increased to 5.916 percent in March 2020 from 0.890 percent in December 2019 because of two transactions that defaulted due to financial and operational issues that pre-existed the outbreak of COVID-19.

Note: “Sub-Saharan Africa” and “Small Business” categories include all transactions that are partially or wholly attributed to these respective categories. The “100% Sub-Saharan Africa” and “100% Small Business” categories only include transactions that are wholly attributed to these categories.
**Risk Rating: By Mandate**

EXIM risk rates its portfolio using a 1 – 11 budget cost level (BCL) scale. The ratings are based, in general, on a borrower’s (1) ability to make payments, as indicated by relevant economic factors and (2) willingness to pay, as indicated by payment record and political and social factors. Four categories, ratings 1 through 4, are roughly equivalent to “creditworthy” or “investment grade” private bond ratings. Three categories, ratings 9 to 11, are for countries either unable to pay fully, even with extended repayment periods, or currently unwilling to make a good faith effort at repayment. EXIM does not use the BCL scale for its working capital and multi-buyer insurance products, as these products are evaluated using a portfolio analysis approach.

Using the BCL at the time of authorization and based on the authorized amount, EXIM’s active portfolio’s weighted average risk rating is 3.82, corresponding to an investment grade portfolio. The following table provides the weighted average BCLs for the various EXIM mandates.

</table>
In addition to measuring the current default rate, EXIM regularly examines the current portfolio to measure the future default rate under stressed scenarios, as well as to identify how the current portfolio may perform in the future under stressed scenarios. As the Basel Committee on Banking Supervision states, “Stress testing should be used as risk management tool” for risk identification, monitoring, and assessment. The following section describes what stress testing is, why it is important, how to do stress testing, EXIM stress test protocol, and recent results from EXIM’s stress tests.

**WHAT IS STRESS TESTING?**

The Federal Deposit Insurance Corporation defines stress testing as “a forward-looking quantitative evaluation of stress scenarios that could impact a banking institution's financial condition and capital adequacy.” The Federal Reserve has provided a similar definition: “For purposes of this guidance, stress testing refers to exercises used to conduct a forward-looking assessment of the potential impact of various adverse events and circumstances on a banking organization.” In sum, stress testing is forward-looking in nature and there are multiple stressed scenarios that could impact the current portfolio and current default rates.

**WHY IS STRESS TESTING IMPORTANT?**

EXIM follows a formalized stress testing protocol. Consistent with Federal Reserve guidance, EXIM’s stress testing builds capacity to understand EXIM’s risks and the potential impact of stressful events and circumstances on EXIM’s financial condition. Stress testing is an important tool for portfolio management and risk mitigation. Furthermore, the International Monetary Fund states: “Stress testing has become an essential and very prominent tool in the analysis of financial sector stability and development of financial sector policy.” The World Bank concurs, stating, “Regular stress testing of the financial system is the main tool of macroprudential monitoring.” Finally, EXIM’s Inspector General recommended that “EXIM should develop a systematic approach to assess and monitor its risk exposure.”
to stress testing and should conduct stress testing at least annually as part of its re-estimate process." Based on industry best practices and EXIM’s commitment to a comprehensive risk management framework EXIM implemented a stress testing protocol in FY 2014.

**HOW DOES STRESS TESTING WORK?**

The International Association of Credit Portfolio Managers made two overarching recommendations for portfolio stress testing:

1. The institution should have a “top down” stress-testing process in place to analyze the impact of extreme economic events on the credit risk of the overall credit portfolio; and

2. The institution should supplement the “top down” approach with a “bottom up” stress-testing process to measure the impact of adverse events on obligors, or sets of obligors, with significant exposures in the credit portfolio.

**EXIM STRESS TESTING PROTOCOL**

On an annual basis, EXIM looks at different ways to perform both a top-down analysis on the entire portfolio as well as a bottom-up approach on certain sets of obligors. For the top-down stress test EXIM decided to use a Monte Carlo simulation approach, consistent with best practice. This approach allows EXIM to look at numerous scenarios. A report published by the Society of Actuaries found that “the Monte Carlo simulation is one of the most widely used methods of stress testing.”

This allows EXIM to use a forward-looking approach that looks at numerous scenarios. The simulation takes every transaction in EXIM’s exposure and simulates whether it defaulted or not during the remainder of its term, based on EXIM’s most current loss rate model. In the default simulation, the total default amount less recoveries is calculated. This loss rate model is reviewed annually by the Office of Management and Budget and audited by KPMG. Each portfolio simulation takes every transaction and sums their respective default amounts. The total is EXIM’s loss for that simulation. EXIM then runs this same simulation 20,000 times to create a distribution of possible losses. There are a variety of outcomes. By creating a distribution of possible losses, EXIM is able to look at the extreme tails of the distribution to see how the portfolio performs at its worst. In essence, this means EXIM looked at 20,000 different “lives” of the portfolio. In some lives perhaps many more defaults occur than expected, others have fewer defaults than expected. By running so many different lives of the portfolio, EXIM can isolate those times where many more defaults occur and look at the impact. EXIM is also able to put probabilities around the chance that these events could occur. Furthermore, EXIM looks at the results of these scenarios if no recoveries occur. This is an extreme scenario as EXIM regularly recoups more than 50 cents on

---

the dollar after payments have been made to financial institutions as a result of borrower non-payment or insurance payouts. Recoveries do take time and this scenario can show what the stressed default rate could reach with no recoveries, albeit temporarily.

For the bottom-up approach, EXIM looks at applicable data from the Federal Reserve’s Comprehensive Capital Analysis and Review adverse and severely adverse scenarios. These scenarios are applied to the largest obligors to determine the adverse scenario the average risk rating. In doing this, EXIM is able to measure the risk of each obligor similar to a Moody’s or S&P credit rating but using a 1-8 scale. EXIM measures the impact on these obligors under the adverse and severely adverse scenario, resulting in a 1.2 notch and 2.5 notch downgrades, respectively. In effect, this scenario would increase the riskiness for a typical transaction by 30 percent for adverse scenarios and 63 percent for severely adverse scenarios.

Next, EXIM runs another 20,000 trial simulations of the entire portfolio based on the results of the obligor specific stress tests, each obligor is downgraded by two notches. This effectively moves an A1 rated credit to a Baa3 credit or a Baa3 to a Ba3 on the Moody’s scale. These scenarios allow EXIM to look at its risk profile from a variety of perspectives and helps EXIM ascertain the current risk within the portfolio.

As part of its stress testing process, EXIM reviews its stress testing protocol on an annual basis.

**EXIM Standard Stress Testing Results**

EXIM stress tests its portfolio semiannually. The results of EXIM’s 20,000 trial Monte-Carlo simulations from March 2020 can be seen in the table below. The default rate at the end of March 2020 was 0.473 percent. Under the baseline forecast the median default rate for the current non-overdue portfolio is 0.37 percent with a 95 percent confidence level that it will be at 1.97 percent or lower. Under a stressed scenario where all of the ratings were downgraded by two BCL notches, the median default rate would increase to 1.87 percent with a 95 percent confidence level that the default rate would be below 3.21 percent. Finally, under a stressed scenario where none of the defaults were ever recovered the median default rate would be 0.80 percent, with a 95 percent confidence level that it would be below 4.04 percent.

In addition to calculating the default percentages, which is on the same scale as the default rates discussed earlier in this report, EXIM calculated the total dollar loss of this distribution. The amount overdue for the portfolio at the end of March 2020 is $0.5 billion. Under the baseline forecast the median loss amount for the current non-overdue portfolio is $0.36 billion. Under a stressed scenario in which all of the ratings were downgraded by two notches, the median loss
amount would increase to $1.79 billion. In a stressed scenario where none of the defaults were ever recovered, the median loss amount would be $0.76 billion.

</tbody>
</table>

These results are comparable to the results from the last stress test performed at the end of September 2019. The median under the baseline forecast in March 2020 is 0.37 percent compared to 0.38 percent in September 2019.

For March 2020, EXIM ran additional stress test scenarios to analyze the financial and economic impact of COVID-19 on its portfolio. These results are discussed in the next section called “COVID-19 Impact Analysis.”

Overall, the results of EXIM’s standard stress is in line with prior stress tests given that, up until March 31, 2020, transactions have been generally repaying, leading to a reduction in exposure. The outbreak of COVID-19, however, could potentially affect the risk profile of the portfolio in the coming months and accordingly change the results of upcoming standard stress tests. EXIM will continue to monitor the situation, and the next section provides additional analysis on the potential impact of COVID-19 on its default rate and losses.

**COVID-19 Impact Analysis**

COVID-19’s impact on EXIM’s portfolio has the potential of impacting most of its borrowers as each of them responds in their own way to the economic fallout caused by this virus. Over the next six months, EXIM expects its borrowers will focus on maintaining sufficient liquidity over the short-term and cutting costs as much as possible to offset the sharp decline in revenue.

**Short-Term Impact Analysis**

EXIM assessed what the impact on the default rate would be if borrowers were exhibiting a relatively moderate or high risk of missing individual debt service payments between April 1, 2020, and June 30, 2020. Because of the exigent circumstances presented by the COVID-19 crisis, individual missed installment payments do not necessarily translate to a default of the entire credit; instead, most credits will likely continue to perform over the long-term. As such, the assessment of high concern does not necessarily translate to a high probability of default for the entire credit, but the classification can serve as a basis for a short-term analysis of the potential range of the default rate in the coming three months. In keeping with this assumption, the analysis does not add the total exposure for these credits into the analysis, but rather includes only those individual payments during the period.
Short-Term Impact Analysis - Results

The short-term analysis builds off the March 2020 default rate calculation outlined earlier in this report. Since the period for this analysis covers April 2020 to June 2020, EXIM assumed the Total Financing (i.e., the denominator of the default rate calculation) would remain unchanged from March 31, 2020, at $105,863.4 million.11 The March 2020 Overdue Payments of $500.3 million (i.e., the numerator of the default rate calculation) served as a starting point for assessing the impact of potential short-term defaults of borrowers that are experiencing liquidity issues. EXIM assumed that it would not collect any recoveries or pay any expenses related to recovery efforts during this period.

If all the borrowers with a high level of immediate payment concern defaulted on their upcoming individual payments through June 30, 2020, then EXIM’s overdue payments would increase to $557.1 million and thereby increase the default rate to 0.526 percent. In addition to these borrowers with a high level of concern, if all borrowers with a medium level of immediate payment concern defaulted during the same period, the overdue payments would increase to $831.7 million, increasing the default rate to 0.786 percent.

Overall, even as certain borrowers are experiencing elevated risk of missing their immediate debt service payments, in the short-term the default rate is not expected to reach the statutory two percent cap at which EXIM’s lending cap would immediately freeze.

Medium-Term Impact Analysis: Industry Sector & Region

EXIM executed additional stress test scenarios that model the possible medium-term impact of the financial and economic fallout from the outbreak of the virus. COVID-19 is expected to have a major impact on Transportation, Commodities, and Sovereign (non-Transportation) portfolios, but may have a limited impact on Power and High-Tech portfolios. Additionally, the impact on a particular industry could vary depending on the geographic region.

---

11 While Total Financing would change over the next quarter, the impact on the overall default rate is approximately one-half of a basis point for every $1 billion added or subtracted to the denominator. As such, assuming a steady Total Financing amount would not have a material impact on the analysis.
Depending on the length and severity of the crisis, financial conditions could warrant rating downgrades for impacted industries or regions. Given this potential outcome, EXIM developed a stress test scenario that applies a risk rating downgrade to every transaction based on an assessment of the impact of COVID-19 on a particular region and industry risk. By applying a set risk rating downgrade to all transactions that fall into a given sub-portfolio, EXIM can simulate the potential deterioration of credit quality for key sectors in its portfolio and therefore assess COVID-19's impact on potential losses. The risk rating notch downgrade by risk classification for this scenario is outlined in the table below:

</table>

For example, if EXIM determined that COVID-19 would have a “Medium to High” impact on the Transportation industry in the Asia-Pacific region, then in this stress scenario all Transportation transactions in the Asia-Pacific region would have their current risk rating downgraded by three notches. For regions and industries where COVID-19 is expected to have a “Low” impact, transactions would retain their current risk rating.

Medium-Term Impact Analysis - Results

By applying the region and industry risk rating parameters discussed above, the expected default rate (i.e., the median value of all the simulations) would be 1.49 percent with the 95 percent confidence interval at 3.23 percent. Relative to the base case scenario's median default rate of 0.37 percent discussed in the “Stress Test” section, these results show that COVID-19 could potentially increase the median default rate closer to the two percent threshold at which EXIM's exposure would freeze.

Additionally, in a scenario where the region and industry risk parameters are applied and EXIM does not make any recoveries on the defaults, the median default rate would be 3.33 percent with the 95 percent confidence interval at 6.88 percent and therefore exceed the two percent threshold. As discussed in the “EXIM Stress Testing Protocol” section, a no recoveries scenario is an extreme scenario in the long-term given EXIM's historical recovery experience. This stress scenario, however, could show what temporarily happens to the default rate after EXIM pays a

---

12 As described in the “EXIM Stress Testing Protocol” section, EXIM's internal risk rating system is similar to Moody's or S&P's credit rating, but utilizes a 1-to-8 scale.

13 For the purposes of this report, EXIM defines the medium-term as approximately six to 24 months in the future.
claim but before recovery efforts are completed. Historically, EXIM recoups more than 50 cents for every dollar paid out in claims. The results of these scenarios are provided in the table below.

</tbody>
</table>

While EXIM is currently within the parameters of the two percent default rate, it is closely monitoring its credits and defaults and taking proactive measures to provide relief through restructuring efforts.
